

- 191 On approaching bends where visibility is poor, use your high beam. This will attract the attention of other road users and warn them of your approach.

- 192 It is safer not to out-drive your normal headlight range. The average headlight on high-beam is about 100 metres.

193 ROAD CONDITIONS

A good driver should know how to read and adjust his/her speed accordingly to suit the road conditions, such as:

- (a) The width of the road;
 - (b) The kind of road surface he/she is driving on;
 - (c) The contour of the road;
 - (d) The possible danger of hazards ahead.
- 194 On a sandy or pebbled surface, there is a greater risk of 'side slipping'. Try to avoid hard acceleration, braking and sudden sharp turning of the steering wheel.
- 195 If the rear of your vehicle skids side way, remove the foot from the accelerator at once. Never apply the brakes during a skid correction, steer in the direction of the skid.
